

Computer Desks / Cabinet Project

This project involved designing & building three computer desks, and one lockable storage cabinet. This project was undertaken in order to better organise workflow for the self-owned business; PlasmaPC.

Each desk has power sockets built-in for testing & fault-diagnosis of newly built desktop computers, or other IT equipment. These cost-effective & functional desks provide the additional work area required for a growing business, and improve the overall aesthetics of the workshop.

The desks & cabinet are constructed from low-cost exterior-grade ply, and pine batten of varying sizes. The surfaces are edged with a profiled pine bead to give them a professional look, and finished with a coat of high-gloss polyurethane varnish. Inside the cabinet is a specially designed shelving system for storing spare computer parts & stock.

The project was completed on 27/06/2011.

The project photos are shown below.
